

## New Product Announcement:

# ST-2000

**Professional stethoscopic headphone for language translation; assistive listening & stenography**

Consumers really like our AudioLink® stethoscopic infrared receivers, but we don't have receivers compatible with existing FM listening systems and, until recently, we didn't have one for Loop systems.

Many FM system owners and users detest little earbuds, but they also don't want to wear conventional headphones over their head. It's just a matter of perceived image.

What to do?? Well we just took our successful receiver and developed a stethoscopic headphone based on the same design. The result is an ultra-light, ultra-comfortable, ultra-durable, high performance headphone for use with ANY ALD, Language translation system or Stenography system.

2KS is the stereo version (32ohm neodymium drivers) and 2KM is the mono version (64ohm neodymium drivers in parallel for a net 32ohm load). Again 2KM will transition to 2KD in the future as we move to the dummy stereo/mono compatible configuration. Cable length is 1.0m and plugs are 3.5mm. Earpieces are washable, hypoallergenic silicone and have replaceable cerumen filters.
